ABSTRACT:

**PURPOSE:** To detect a position accurately by providing a converting means for converting a pattern, which shows existence of a notch of a disc by a predetermined bits, as the output signal of a magnetic sensor means to the absolute position signal which shows an absolute position of the disc.

**CONSTITUTION:** An A.B phase detecting magnetic sensor part 3 is provided in an encoder so as to detect a notch part by 4 bits of a Z phase disc 1 for detecting absolute position. 4 signals from this sensor part 3 are sent to a code converting unit 11 to be converted to the digital signal. The relation of a bit pattern of binary circulating random number sequence with an absolute position is memorized previously in this converting unit 11, and the absolute position signal Sab, which shows an absolute position within one rotation of a rotating shaft, is obtained on the basis of the pulse code of 4 bits of the signal from the sensor part 3, and is sent to an interpolation signal composing unit 10. In the composing unit 10, the signal Sab is added to the interpolation signal S from the interpolation signal converting unit 9 to be

output as the high accurate absolute position signal.
